

Weekly Briefing — Issue #6

Everything that mattered in AI this week, and what you should do about it.

Week of Jun 29 – Jul 5, 2026 | Prepared for Jaroslaw

The 60-second version

- **The week in one idea: the black box grew a dashboard — so your edge moved to reading the gauge and feeding it one clean input.** Last week the work became *delegable* (hand off the doing, own the guardrail); this week the platforms you delegate to cracked open and handed you a **meter** that used to be hidden — Microsoft's verdict on your email (SNDS), Performance Max's reason a channel is dark (Channel Diagnostics), Instagram's inferred topics for your account (Your Algorithm), your own eval numbers on a suddenly-cheap near-frontier model (Sonnet 5). And under every play the winning move was the same: don't do *more* work — feed a **cleaner input** (one real product photo, one unmistakable topic, one saved brand style, one honest target, one routing policy) and let the machine execute. Stop guessing. Read the gauge, fix the one input it points at.
- **Design + Dev — the platform kept absorbing the plumbing, so 'declare it once, delete the code' was the pattern.** Web design landed two **delete-the-JavaScript** wins: the native `<select>` is now CSS-styleable (appearance: `base-select`, and confirmed coming to a 2nd engine, Safari 27) and `field-sizing`: content reached full **Baseline** (Firefox 152) — a textarea that grows itself in one line of CSS, for every user, so you drop the autosize library outright. Dev: Vercel now runs **any container** from a `Dockerfile.vercel` (the last always-on box — FFmpeg, Chromium, a Go/Rails API — moves next to your frontend on active-CPU billing), and **AI Gateway routing rules** let one team-wide policy rewrite/deny the model and fail over on an outage instead of a model hard-coded at ten call sites. State the intent once; let the platform hold the hard part.
- **AI tooling — the cheap tier moved up, so re-run your eval and re-point the router (don't reprice on the headline).** Anthropic shipped **Claude Sonnet 5** (`claude-sonnet-5`, Jun 30) — near-Opus-4.8 agentic quality at **\$3/\$15** per M tokens (~40% under Opus, intro \$2/\$10 through Aug 31) and now the default on Free/Pro and in Claude Code. The play isn't 'switch everything' — it's the **router move**: run 3–5 of your *real* tasks against it, move the bulk/agentic/long-horizon work to whatever passes, and reserve Opus for the hardest ~10%. It resolved our Jun 6 'a Sonnet refresh reprices the mid-tier' call ■ (honest caveat: a full version bump, not the guessed 4.8 point release), and pairs with the open-weight GLM-5.2 route as the hosted-near-frontier leg of the same lesson.
- **Marketing — every win was 'set a clean input / read a hidden gauge,' not more manual work.**
Graphic: teach the machine your look ONCE — Recraft's saved **Style** (a brand-style lock from 5–10 reference images) and Higgsfield's **AI Product Photography** (one real product photo → on-model, colorway and video catalog, batched across SKUs with a locked house model via Soul ID). **Email:** claim **Microsoft SNDS** — the free, IP-based gauge of how Outlook/Hotmail rate your sending (the missing Microsoft half beside Gmail Postmaster; it changed in Jun 2026, so re-claim it). **Paid:** Performance Max stopped being a black box — **Channel Diagnostics** tells you WHY a channel is dark (missing/rejected assets, a fantasy target) so you fix the input; and **Reddit Split Testing** went GA for a clean, one-variable A/B. **Social:** Instagram is moving **Your Algorithm** topic control into in-feed gestures, so make every post unmistakably one topic; X's **Live Studio** puts viewer/comment-peak analytics on a desktop dashboard. **CRO/AOV:** don't import a case study — hand AI your own 90-day order export, let it name the single biggest dollar leak, and pull ONE lever pegged to your *modal* order value.

- **News — the model layer hardened into a governed, geopolitical, compliance surface while the market audited the profit.** Policy: the EU's top court upheld Google's **€4.1B** Android fine (final); OpenAI floated handing the US government a **~5% stake**; and **Anthropic began closing the loopholes** Chinese firms (Ant, ByteDance) used to reach Claude — legal, but against its ToS — as it heads toward an IPO. Markets: the 'show-me-the-profit' selloff hit the chips again (Samsung -9.06%, SK Hynix -14.57%) even as **SpaceX's \$25B debut bond** drew ~\$89B of orders — capex-hunger meeting ROI-scrutiny in one trade. And the loudest booster gave the hype a haircut: **Zuckerberg** conceded agentic AI 'hasn't really accelerated in the way that we expected.' The durable read: know **which** model, **where** it runs, and that your use fits ToS/jurisdiction; build client AI for **portability**; lead with **cost-per-outcome + a spend ceiling**; and scope agents narrowly with a human in the loop. Our open Jun-8 'dip, not regime change' call [due ~Jul 20] stays open and under real pressure — judged at the window.
- **Sharpen your edge:** the connective thread to last week ('hand off the doing, own the guardrail') is direct — once you've handed off the doing, the platforms are finally letting you **see in**, and the operator job narrows to two moves. **Read the gauge:** SNDS, PMax Channel Diagnostics, Your Algorithm's inferred topics, your own eval on Sonnet 5 — stop guessing where you used to guess. **Feed one clean input:** a real product photo, a saved brand style, one unmistakable topic, an honest target, one routing policy — and let the machine execute. Take the automation. Read the meter. Fix the input.

The week in one idea: read the gauge, feed one clean input

The platforms cracked open — the meter you used to guess at is now on the dashboard

Line the week's plays up and they rhyme. Microsoft's **SNDS** shows you the exact filter verdict — green / yellow / red — on your sending IPs at Outlook/Hotmail, the half of the inbox Gmail Postmaster never covered. Performance Max's **Channel Diagnostics** finally says WHY a channel isn't serving (a missing vertical video, a disapproved asset, a fantasy target) instead of leaving you to argue with a black box. Instagram's **Your Algorithm** exposes the plain-language topics it has filed your account under. And **Sonnet 5's** launch benchmark is a number you're explicitly told *not* to trust — the gauge that matters is your own eval, on your own tasks. A year ago each of these was hidden; this week they're a dashboard you read. The operator skill shifts from 'guess and hope' to 'open the gauge, read it, act on what it names.'

Synthesis, not recap: the email, paid, social and AI-tooling beats this week are the same story from four crafts — the platform stopped hiding its verdict, and the news beats rhymed (even Zuckerberg read his own dashboard out loud).

And under every play, the lever was a cleaner INPUT — not more of your work

The twin of reading the gauge is what you do about it: you don't grind harder, you feed the machine a better input and let it execute. Higgsfield turns *one real product photo* into a whole on-model, colorway and video catalog — the skill is choosing the input and locking a house model, not booking a shoot. Recraft turns *5–10 on-brand reference images* into a saved Style that makes every later generation match. Instagram rewards *one unmistakable topic* stated in the first caption line, the on-screen text and the first three seconds. Vercel's AI Gateway turns 'which model' into *one routing policy* instead of a model hard-coded at ten call sites; its `Dockerfile.vercel` turns 'the one service we couldn't build here' into *one file*. And the CRO answer to 'the best one thing' is: let your *own order data* name the leak, then peg one lever to your modal order value. Clean input in, machine does the doing.

Do this: This week's homework, one line each: claim **Microsoft SNDS** and read its filter status the same day you read Gmail Postmaster (email); open **PMax Channel Diagnostics** and fix every flagged missing/rejected asset and fantasy target (paid); re-run your standing eval of 3–5 real tasks against **Sonnet 5** and re-point the router (AI); build one **Recraft Style** from your on-brand references and turn one existing product photo into an on-model set with **Higgsfield** + a locked Soul ID (graphic); add appearance: `base-select / field-sizing: content` to delete one JS dropdown or autosize dependency (design); front one service with a `Dockerfile.vercel` and set one **AI Gateway routing rule** with a fallback (dev); and hand AI your 90-day order export to name your single biggest dollar leak (CRO).

What changed, and what to do — by domain

One tight synthesis per domain that moved this week. The throughline (read the gauge, feed one clean input) shows up differently in each.

Web design — delete the JavaScript: the browser now does the sizing and the dropdown behaviour for you

[web-design · css · forms · baseline]

Two form-control primitives landed that let you remove code, not just decorate. **Customizable** `<select>` (appearance: `base-select` on both the `<select>` and its `::picker(select)`, Chrome 135+) lets you fully style the closed control, the open picker, each option, the checkmark and the arrow — and put rich HTML (a flag, an avatar) inside options — while the browser keeps all keyboard and screen-reader behaviour for free; WebKit confirmed (Jun 15) it's **coming to Safari 27**, the 2nd engine, putting it on the path to Baseline. And `field-sizing: content` reached full **Baseline** (Firefox 152, Jun 16) — a `<textarea>` grows row-by-row as you type, a text input shrinkwraps, a select sizes to the chosen option — so you can delete the autosize library (react-textarea-autosize / scrollHeight handlers) for *all* users. The gauge here is the deploy tier: Baseline = delete the dependency; Chromium-only = ship as progressive enhancement.

Do this: For auto-growing message boxes and inline-edit fields, add `field-sizing: content` with a `min-/max-bound` and remove the JS autosize handler — it's Baseline, so no `@supports` needed. For custom dropdowns, set appearance: `base-select` on the select AND its picker, style the parts, keep real text in every `<option>`, and wrap it in `@supports (appearance: base-select)` so non-Chromium falls back to the native control. Don't delete the JS dropdown for everyone until Safari 27 + Firefox ship to stable.

Keeper distinction: `field-sizing` is the FIRST fully-Baseline leg of the modern-CSS-primitives thread (delete-the-dependency), while customizable select is still Chromium-only (enhance-only) — flag which branch a feature is on before you say 'ship it.' Cards: card-webdesign-field-sizing, card-webdesign-customizable-select.

Web dev — the platform absorbed the last box and the model decision; declare the policy, not the plumbing

[web-dev · vercel · docker · ai-gateway]

Two Vercel drops continued the 'platform absorbs the backend' thread. **Dockerfile.vercel** (Jun 30): drop in one file and Vercel builds, stores, deploys and autoscales *any* container on Fluid compute (active-CPU billing, idle near-free) — so the one service Vercel couldn't auto-build (a Go/Rails/Spring API, anything needing FFmpeg or headless Chromium) moves next to your frontend instead of onto a second always-on host you patch and pay for around the clock. The contract is small: listen on `$PORT`, speak HTTP, stay stateless. And **AI Gateway routing rules** (beta) turn model choice into a declarative, team-wide policy: a rule can **rewrite** a request to a cheaper model or **deny** a model outright, and **fallbacks** reissue to a healthy alternative on an outage (Vercel says ~3.5% of requests complete only because of a fallback). Both replace hand-maintained sprawl — a separate box, a model hard-coded at ten call sites — with one declaration.

Do this: For a media/PDF/legacy-API service, write a normal Dockerfile named `Dockerfile.vercel`, externalize state to a backing service (Redis/Postgres/blob), and let `git push` deploy it — but cost active-CPU against your traffic shape (a pinned-100%-CPU box can still be cheaper). Front your LLM calls with AI Gateway and add a rule that sends bulk work to a cheaper model plus a fallback chain — but keep it off your highest-stakes path (it's beta) and keep a hard dollar cap where the budget is the risk (routing + fallback is NOT a spend cap).

Both are single-vendor-primary and pre-GA (the Dockerfile flow documented; routing rules explicitly beta) — prototype, don't bet the critical path yet. Advances thread-platform-absorbs-backend (WebSockets, durable workflows, cancelable jobs). Cards: card-webdev-vercel-dockerfile, card-webdev-vercel-ai-gateway-routing.

Graphic — teach the machine your look ONCE, then let it generate the whole set on-brand

[graphic · recraft · higgsfield · brand · ai-image]

The graphic wins were both 'define the input once, get a coherent set out.' **Recraft's Style** system turns 5–10 consistent brand images into a saveable, team-shareable **Style ('Style Lock')** that constrains every later generation to your colour treatment, line weight and composition — brand-system management, not prompt-roulette. And **Higgsfield AI Product Photography** (answering a team Ask from Jarek) turns one existing PDP product photo into a whole apparel catalog — studio / lifestyle / on-model / detail shots, flat-lays and colorway variants, batched across SKUs with **AI Batch Catalog + AI Variant Sets**, made consistent by locking one repeatable 'house model' with **Soul ID**, then extended into a video lookbook via image-to-video (Sora 2 / Kling / Veo / Seedance) and automatable through a hosted MCP server. Same move both times: the skill is choosing and locking the input, not re-describing

the look on every asset or booking a studio.

Do this: Build a Recraft Style from your most on-brand references, name it, and generate icons/spots/social cards against it so a deck reads as one family (pair with V4 Vector for editable SVG). For a clothing client, feed real product photos into Higgsfield, lock a Soul ID house model, template directions per garment type before you batch, upscale/resize per platform, and keep a human gate on fit/drape and **commercial-use rights** before publish.

Both are tool-primary how-tos with independent corroboration; the durable guardrail is the same — AI drifts on fine product details and licensing, so a human QA gate on details + rights is non-negotiable. Cards: card-graphic-recraft-brand-style-lock, card-graphic-higgsfield-product-photography.

Email — claim the second gauge: how Microsoft rates your sending, free (and it changed in June)

[email · deliverability · microsoft · snds]

Our deliverability thread had taught the Gmail side hard (Postmaster's verdict, DMARCBis np=reject, the re-engagement/sunset flow) and left a hole: **Microsoft. SNDS** (Smart Network Data Services) is Microsoft's free counterpart to Gmail Postmaster — but **IP-based** (you register the sending IPs), covering the ~350M Outlook/Hotmail/Live inboxes Gmail's domain-based view misses. Per IP it shows a plain filter status (green healthy / yellow watch / red junked-or-blocked), spam-trap hits, complaint-rate trend and volume; pair it with the **JMRP** feedback loop to see which messages got marked junk. The fresh hook: SNDS **changed in Jun 2026** — the portal moved to a new URL (Jun 8, old links dead), there's a new REST API with OAuth 2.0, automated CSV links now expire after 30 days, and JMRP is now ARF-standardised (headers only, no body). If you send real consumer volume, half your audience likely sits behind Microsoft's filter and you've been flying blind there.

Do this: Register/verify your sending IPs at SNDS, turn on JMRP and wire complainers straight to suppression, then read the gauge weekly (red daily): treat red as a fire, yellow as investigate, any spam-trap hit as a list-hygiene alarm (this is where the re-engagement/sunset flow pays off). Fix any June-2026 plumbing (dead bookmarks, 30-day CSV expiry, header-only JMRP) and make 'read SNDS + Gmail Postmaster' one recurring ritual.

Confirmed across Litmus + Microsoft's own SNDS site + practitioner guides; most actionable on dedicated IPs (on a shared-IP ESP plan, ask the ESP for its SNDS view). The Microsoft leg of the deliverability thread, distinct from the Gmail-Postmaster verdict and the DMARCBis auth fix. Card: card-email-microsoft-snds.

Social — read your inferred topics, then make every post one unmistakable topic (and run streams like a show)

[social · instagram · x · reach]

Two social moves, both about reading a newly-exposed gauge and feeding a cleaner signal. Instagram is moving 'Your Algorithm' topic control into in-feed gestures (pull-down topic menu, swipe-up-on-Reel, per-Reel more/less buttons, demoed Jun 27) — so viewers now send explicit 'more of this / less of you' signals in the moment, and your own account's **inferred topic labels** become a gauge you can open and read. The design response is unchanged but sharper: state **one topic per post** in the first caption line, the on-screen text and the first three seconds, so the 'more like this' taps land on you and off-niche posts don't get suppressed. Separately, X shipped **Live Studio**, a desktop streaming command center with the analytics in the same place — schedule, title/thumbnail, gate access, and read **viewer/comment peaks + audience demographics** off the dashboard so you stop guessing your best live window (advanced features need X Premium; a \$1M creator fund is live now).

Do this: Open Your Algorithm on your own account and check whether the inferred topics are sharpening toward your niche — if they're scattered, your signals are too mixed; tighten the first-line / on-screen / first-3s topic cue and park off-topic posts in Stories. If a client is on X, run their next livestream from Live Studio and read the viewer/comment-peak analytics to set the following stream's time.

Instagram's gestures are tests ('some may not ship') — design for the durable takeaway (explicit viewer-level topic control is coming to the feed), which works today regardless of which gesture lands. Cards: card-social-instagram-your-algorithm, card-social-x-live-studio.

Paid — Performance Max stopped being a black box; fix the input it names, and A/B cleanly on Reddit

[paid · google-ads · performance-max · reddit-ads]

The paid story was a rare window into the automation. Google Ads added **Channel Diagnostics** to Performance Max (under Insights & Reports → Channel performance, rolling out Jul 2): it aggregates the fixable reasons a channel (YouTube, Search, Gmail, Maps...) is limited or dark — **missing or rejected assets**, an **unrealistic target**

(tCPA too low / tROAS too high), weak Ad Strength, audience-signal or conversion-tracking problems. The honest read is part of the gauge: a channel with *no* issues that still isn't serving just means PMax is bidding elsewhere for higher ROI right now — that's the algorithm working, not a bug. Separately, **Reddit Split Testing** went GA to all advertisers (Jul 3): native user-level A/B in Ads Manager, one variable changed, a winner at 65% confidence over 2–6 weeks (\$1,000/day minimum) — a clean read that replaces eyeballing two campaigns that ran at different times to overlapping audiences.

Do this: Run a 60-second Channel Diagnostics scan per PMax campaign: fix every flagged missing/rejected asset (usually a 9:16 video and enough image ratios) and pull any fantasy target back toward trailing actuals; don't force a channel PMax is skipping for ROI. Where Reddit is in the mix and you can clear the \$1,000/day floor, run one-variable Split Tests to the confidence call and roll the winner forward as a standing loop.

Channel Diagnostics is a staged rollout (not every account yet) and a diagnostic surface, not new control — you fix inputs, not force placements. Reddit's \$1,000/day floor and 65% bar make it directional iteration guidance, not statistical proof. Cards: card-paid-pmax-channel-diagnostics, card-paid-reddit-split-testing.

CRO & AOV — let your own order data name the single biggest dollar leak, then pull ONE lever

[cro · growth · aov · analytics]

A standing team Ask — 'the best ONE thing for CRO and AOV?' — got the honest answer: there's no universal one thing, there's the one thing *your* numbers say leaks most, and AI makes that a sub-hour diagnosis. Hand Claude/ChatGPT your last-90-day order export + GA4 funnel and have it compute your AOV and your **modal** (most common) order value, then rank the leak. If it's basket size, set a free-shipping threshold **just above the modal order value** (it should land ~15–25% over current AOV — not a round number, not the blunt '30% above AOV' rule) with a dynamic 'You're \$X from free shipping' progress bar (the goal-gradient nudge). If it's checkout drop-off, kill friction first — guest checkout, fewer fields, full cost shown early (unexpected costs drive ~48% of abandonment, per Baymard). This is the read-your-own-gauge move applied to your storefront: your distribution picks the lever, not someone else's case study.

Do this: Export the data, have AI compute AOV + modal order value and rank the leak, ship ONE lever pegged to the modal value, and measure AOV, conversion AND margin together for 3–4 weeks — a higher AOV you fund with absorbed shipping can be a net loss.

Answers a standing team Ask (mark it addressed). Authoritative + practitioner corroboration (Baymard, Shopify, Digital Applied); the defensible move is the diagnose-then-one-lever discipline + the margin guardrail, not any single stat. Card: card-cro-ai-diagnose-one-lever (updated).

AI tooling — the cheap tier moved up; re-run your eval and re-point the router, don't trust the headline

[ai-tooling · claude · sonnet-5 · model-router]

Anthropic shipped **Claude Sonnet 5** (claude-sonnet-5, Jun 30) — the most agentic Sonnet yet, with higher-effort performance 'close to Opus 4.8' on many tasks (an independent agentic-coding read: 63.2% vs Opus 4.8 69.2%, Sonnet 4.6 58.1%) at **\$3/\$15** per M tokens (~40% under Opus's \$5/\$25), an intro **\$2/\$10 through Aug 31 2026**, and it's already the default on Free/Pro and in Claude Code. The operator move is the exact trap our durable lesson warns about: **don't reprice your stack on a launch benchmark** — the gauge that matters is your own eval. Treat Sonnet 5 as a new candidate in your model router, run your real tasks against it, move the large middle of the work (bulk drafting, most agentic/coding loops, long-horizon jobs) to whatever passes, and reserve Opus for the hardest ~10%. It's the hosted-near-frontier companion to the open-weight GLM-5.2 route — same discipline, different lever.

Do this: Take 3–5 of your own real tasks, diff Sonnet 5 against your current default (Promptfoo makes it a one-file job), re-point the router where it passes, and bank the discount deliberately — the \$2/\$10 intro ends Aug 31, so turn on prompt caching (up to 90% off) + batch (50%) for non-interactive work. Re-check monthly; rankings and prices move weekly.

Resolved our Jun 6 'a Sonnet refresh reprices the mid-tier' call ■ (honest caveat: a full Sonnet 5 version bump, not the guessed 4.8 point release, ~a week past the rough window). Benchmark figures are directional — that's the whole point of the eval step. Card: card-ai-tooling-sonnet-5-default.

News — the model layer became a governed, geopolitical, compliance surface while the market audited the profit

[news · policy · markets · anthropic]

The week's biggest landscape shift: model access hardened into something you have to **account for**. Policy — the EU's Court of Justice upheld Google's **€4.1B (~\$4.7B)** Android antitrust fine (final, Jul 2); OpenAI floated handing the US government a **~5% stake** (~\$42.6B), part of an idea to take 5% of each leading lab; and **Anthropic began closing the loopholes** Chinese firms used to reach Claude (Ant Group via a Singapore entity, ByteDance reimbursing VPN'd personal subs) — legal, but against its ToS — tracking time-zones and killing relays as it marches toward an IPO (confidential S-1 filed Jun 1). Markets — the 'show-me-the-profit' selloff hit the chips again (Samsung -9.06%, SK Hynix -14.57%) even as **SpaceX's \$25B debut bond** drew ~\$89B of orders (~3.5x oversubscribed) while the company carries a ~\$5B net loss: capex-hunger meeting ROI-scrutiny in one trade. And **Zuckerberg** conceded agentic AI 'hasn't really accelerated in the way that we expected.' Adjacent: generative media became real revenue infrastructure — Higgsfield (this week's graphic tool) is reportedly in talks near ~\$5B — and the courts began prying open who actually uses AI (Midjourney's discovery fight vs the studios).

Do this: Treat model access as a compliance surface: for client work, know WHICH model, WHERE it runs, and that your usage fits the vendor's ToS and the client's jurisdiction — and build client AI for **portability** so a policy or availability shock is a config change, not a rebuild. Lead every pitch with cost-per-outcome + a spend ceiling, and — with even the biggest booster conceding agents are slower than hoped — scope agents narrowly and keep a human in the loop; sell bounded automation, not autonomy you can't ship.

Climate signal, not a trade. The open Jun-8 'dip, not regime change' call [due ~Jul 20] stays open and under real pressure from the week's chip rout — judged at the window. The Anthropic access-tightening, OpenAI government-stake, Higgsfield raise, and 2nd-marquee-debt-raise calls are all newly on the board (below).

Techniques & tools worth adopting this week — the keepers

The survivors after killing 95%. Each is a run-it-today play with a real link — and each is either a gauge to read or a clean input to feed.

The shortlist

[technique]

Keeper	What it buys you	Start here + the discipline
Claude Sonnet 5 (the router move)	Near-Opus agentic quality at ~40% lower price	Eval 3–5 real tasks; re-point the router; reserve Opus for the hard ~10%
field-sizing: content (Baseline)	Auto-growing textarea/input in one line of CSS	Add it with min-/max- bounds; DELETE the autosize JS (no @supports needed)
appearance: base-select	A fully styleable native <select>, a11y kept for free	Style the parts behind @supports; ship as enhancement (Chromium-only today)
Dockerfile.vercel	Any container next to your frontend, idle-cheap	Listen on \$PORT, stay stateless; cost active-CPU vs a fixed box
Vercel AI Gateway routing rules	One policy rewrites/denies the model + fails over	Rewrite bulk to a cheaper model + a fallback; keep a hard \$ cap (beta)
Recraft Style / Higgsfield Soul ID	On-brand asset sets + on-model catalogs from one input	Lock the style/house model once; human gate on details + commercial rights
Microsoft SNDS	Free green/yellow/red gauge for Outlook/Hotmail	Register IPs + JMRP; read it beside Gmail Postmaster; red = fire
PMax Channel Diagnostics	WHY a channel is dark, so you fix the input	Fix flagged missing/rejected assets + fantasy targets; don't force ROI-skipped channels
AI CRO diagnosis + modal-value threshold	Your own data names the biggest \$ leak	Compute AOV + modal order value; ship one lever; watch margin, not just AOV

Predictions ledger — resolved & newly on the board

Resolved this week

- ■ **[ai-tooling]** A mid-tier Sonnet refresh reprices the mid-tier (made Jun 6) — Anthropic shipped **Claude Sonnet 5** (claude-sonnet-5, Jun 30): near-Opus-4.8 agentic quality at **\$3/\$15** per M tokens (~40% under Opus), intro **\$2/\$10 through Aug 31**, made the default on Free/Pro + in Claude Code. Honest caveat: the call guessed a Sonnet 4.8 *point release* — it was a full **Sonnet 5** version bump, and landed ~a week past the rough window; substance (a Sonnet refresh repriced the mid-tier) held.

Newly on the board (logged this week, still open)

- **[web-design]** Customizable native <select> (appearance: base-select) reaches Baseline — ships stable in BOTH Safari (27) and Firefox — due ~end of Q1 2027. And a mainstream UI/component library ships field-sizing: content as its default textarea/input auto-resize, dropping a JS autosize dependency — due ~end of Q1 2027.
- **[web-dev]** A 2nd major deploy platform ships a git-push 'deploy any Dockerfile' flow with scale-to-zero / per-active-CPU billing, matching Vercel's Dockerfile-on-Fluid — due ~end of Q1 2027. And Vercel AI Gateway routing rules exit beta to GA AND/OR add a dollar-denominated spend cap (matching Cloudflare) — due ~end of Q1 2027.
- **[graphic]** A 2nd major AI image tool ships a saveable, team-shareable brand-style-lock trained from uploaded reference images (matching Recraft's Style) — due ~end of Q1 2027. And a 2nd creative suite ships a one-upload photo→on-model-catalog + colorway-batch pipeline for apparel with a locked model identity (matching Higgsfield's Soul ID) — due ~end of Q1 2027.
- **[email]** An ESP / deliverability vendor ingests Microsoft SNDS via the new REST API/OAuth 2.0 and surfaces Outlook/Microsoft filter status (green/yellow/red) as a DEFAULT panel beside Gmail's Postmaster verdict — due ~end of Q1 2027.
- **[social]** Instagram ships ≥1 of the in-feed 'Your Algorithm' controls (pull-down menu, swipe-up-on-Reel, per-Reel more/less) to general availability — due ~end of Q3 2026. And a 2nd major platform ships a desktop livestream studio with viewer/comment-peak analytics + a payout incentive, OR X makes livestreaming Premium-only — due ~end of Q1 2027.
- **[paid]** Performance Max Channel Diagnostics reaches general availability (out of test, all accounts) AND/OR adds asset-level performance broken out by channel — due ~end of Q4 2026.
- **[ai-tooling]** The Sonnet 5 repricing sticks or spreads: Anthropic makes the \$2/\$10 intro permanent past Aug 31, OR a 2nd frontier lab cuts a comparable mid-tier agentic model to ≤ ~\$3/\$15 to match — due ~end of Q3 2026.
- **[news]** Anthropic's China access-tightening extends within ~8 weeks (expanded geo/entity enforcement, or a named Chinese firm publicly confirmed cut off) — due ~Aug 28. The OpenAI US-government-stake proposal resolves one way (firms into an agreement with ≥1 lab, or a named lab publicly declines) — due ~Aug 27. And a 2nd marquee AI-infra company raises ≥\$10B in DEBT within ~8 weeks, extending the debt-over-dilution shift (after SpaceX's \$25B bond) — due ~Aug 24; Higgsfield's reported ~\$5B raise resolves (closes ≥~\$3B or is dropped) — due ~Sep 12.

Open climate call still on the clock

- ■ **[news]** The AI-equity sell-off is a dip, not a regime change (made Jun 8) — the Jun-8 basket (SoftBank, Samsung, SK Hynix) closes higher than its Jun 8 level by ~Jul 20. This week's chip rout (Samsung -9.06%, SK Hynix -14.57%) keeps it **open and under real pressure**; we treat intraday index prints as directional and resolve it at the window.

This week's action list

Concrete and assignable, per discipline. Each pairs reading a gauge with feeding one clean input.

- **AI/all** — Re-run your eval of 3–5 real tasks against Sonnet 5 and re-point the router; reserve Opus for the hardest ~10%; turn on prompt caching/batch before the \$2/\$10 intro ends Aug 31.
- **Design** — Add field-sizing: content (with min-/max-) to delete one autosize dependency; style one native with appearance: base-select behind @supports.
- **Dev** — Front one service with a Dockerfile.vercel (stateless, \$PORT); set one AI Gateway routing rule with a fallback, and keep a hard \$ ceiling.

- Graphic — Build one Recraft Style from your brand references; turn one real product photo into an on-model set with Higgsfield + a locked Soul ID (human gate on fit + rights).
- Email — Claim Microsoft SNDS, register your IPs + JMRP, and read its filter status the same day you read Gmail Postmaster.
- Paid — Run Channel Diagnostics on every PMax campaign and fix the flagged assets/targets; start one one-variable Reddit Split Test.
- Social — Read your Instagram 'Your Algorithm' topic labels and make every post one unmistakable topic; run one client X stream from Live Studio and read the peak analytics.
- CRO — Hand AI your 90-day order export + GA4 funnel; compute AOV + modal order value; ship ONE lever and measure AOV, conversion AND margin.
- News/all — Audit one client AI feature for portability + ToS/jurisdiction fit; lead the next pitch with cost-per-outcome + a spend ceiling.
